CRM & Workflows Module Blueprints

Product status as of August 2026 · Companion to the AI Workforce blueprint

1. CRM Blueprint

What it is

CRM is a **real Module 3** sales system: leads → contacts → companies → pipelines → tasks/activities. It is one of the deepest integrations in the app (Inbox, AI Workforce, Ask AI).

Entry point: /crm

Architecture

UI (/crm)

- APIs (/api/contacts, companies, deals, tasks, activities, crm/*)
- CRM store (memory in demo / Firestore in production)

Inbound messages → inbound-crm-bridge → CRM store
AI Workforce / Ask AI → CRM store
Lead score + insights ← CRM store + UI

Surfaces

Route	Purpose
/crm	Overview — stats, forecast, top leads, open tasks
/crm/leads	Lead list (filtered contacts, not a separate entity)
/crm/contacts + /[id]	Contacts + Ask AI, score, insights, linked inbox
/crm/companies + /[id]	Accounts
/crm/pipelines	Kanban + closed deals
/crm/deals/[id]	Deal detail + Ask AI
/crm/tasks	Task board; seed sample; Execute AI tasks

Subnav: Overview · Leads · Contacts · Companies · Pipelines · Tasks

Entities

Entity	Notes
Contact	Core person; tags, leadScore, purchases, conversationIds
Lead	Not a separate model — contacts with prospect / hot_lead / score ≥ 50
Company	Account; industry, size, tags
Pipeline + stages	Demo: Lead → Qualified → Proposal → Negotiation → Won
Deal	open / won / lost; value, stage, contact/company
Task	Human or assignedAgentType; todo / in_progress / done
Activity	call / meeting / note — create + list only (no edit/delete)

Types: `src/types/crm.ts` · Store: `src/lib/data/crm-store.ts`

What works (real)

- Full CRUD for contacts, companies, pipelines, deals, tasks
- Import Excel/CSV/Google Sheet + templates (`/api/crm/import`)
- Lead scoring + AI/heuristic insights
- Inbound → CRM bridge (qualify → prospect + follow-up task)
- Assign AI agents on tasks → Execute / batch process
- Ask AI on contact + deal
- Rules (e.g. UK pack: contact must have email/phone; large-deal approvals)
- Global search, Launch creates company, Founder snapshot reads CRM

Gaps

Gap	Detail
No Lead entity	Leads = filtered contacts
Activities immutable	No PATCH/DELETE
Finance / Knowledge	No CRM coupling
WhatsApp-specific CRM	Indirect via Inbox only
Purchases	Typed/seeded; little dedicated UI
Kanban	Stage moves via controls, not free DnD

Day-to-day use

1. Capture lead — manual, import, or inbound sales-qualified chat
2. Qualify — Score → Insights → tags/owner
3. Account — link company, log activities
4. Pipeline — create/move deals, won/lost
5. Tasks — human or AI; Execute agent tasks

6. Ask AI — contextual commands from contact/deal

7. Empty tenant — Seed sample CRM

Bottom line: CRM is production-capable as the system of record for sales; AI and Inbox plug into it deeply. Finance/Knowledge are not part of CRM yet.

2. Workflows Blueprint

What it is

Workflows is a **BDM playbook engine**: linear trigger → steps → run log. It can touch CRM, Inbox/channels, and AI Workforce for real. Schedule, true delays, branching, and LLM “generate” are weak/stubbed.

Entry point: /workflows

Architecture

Hub (/workflows)

- Create (template or keyword generate)
- Linear step editor
- Manual or event trigger
- execute.ts
 - CRM mutate
 - WhatsApp / email deliver
 - AI Workforce run
 - Awaiting approval → Approve & continue

Surfaces

Route	Purpose
/workflows	Playbooks · My plays · Runs
/workflows/[id]	Editor, enable/delete, test run, history
/workflows/runs/[id]	Step log + Approve

UI mental model: *playbook* → *trigger* → *BDM work* (WhatsApp, email, tags, stages, tasks, meetings, approvals).

Triggers

Trigger	Status
manual	Real
crm_lead_scored	Real (contact create/update, score ≥ 50)
deal_updated	Real (deal create/update/won/lost)
schedule	Stub — type only, no cron

Steps

Step	Status
condition	Real — score/value compare; fail stops run (no alternate branch)
agent	Real — workforce run + apply up to 3 actions
approval	Real — pause until Approve
action	Real — see actions table
delay	Stub — logged, continues immediately

Actions

Action	Reality
create_task / create_activity	Real CRM
tag_contact / update_lead_score / move_deal_stage	Real CRM
send_whatsapp / send_email	Real path → inbox + deliverOutbound (demo simulates)
draft_outreach	Note + draft in context
alert	Soft — CRM note or log
book_meeting	Soft — meeting activity + task; no real calendar

Graph is **strictly linear** — no branches, loops, parallel, or webhooks.

Engine: `src/lib/workflow/execute.ts` · Types: `src/types/workflow.ts`

Create / run

1. Install template (Hot lead chase, First WhatsApp outreach, Book discovery, Deal follow-up, Proposal handoff)
2. Or “Build playbook” from plain English → **keyword** → **template**, not a real LLM
3. Edit trigger/steps → Save → Enable
4. Test run (empty body → Sarah Chen demo context)
5. Automation fires from CRM events when enabled
6. Approval steps → Approve & continue (no Reject UI)

Integrations

Module	Status
CRM	Deep — mutate + event triggers
Inbox / WhatsApp / email	Real send path (simulated in demo)
AI Workforce	Agent steps real
HR inbox automation	Separate — not workflow engine
Deal-won onboarding	Separate demo path; not unified under Workflows

Caveat: workflow CRM writes do not re-emit domain events → no cascade chaining.

Gaps / stubs

1. Schedule trigger
2. Real delay / queue
3. No reject/cancel approval
4. No branching / parallel / webhooks
5. “AI generate” = keywords
6. No drag-drop builder (WorkflowFlowDiagram unused)
7. Soft alert / book_meeting
8. No dedicated workflow tests
9. AGEB marks engine **partial**

Day-to-day use

1. Open Workflows → install playbook or describe play
2. Edit → enable
3. Test with contact/deal
4. Watch Runs; approve if paused
5. Check CRM + Inbox for side effects
6. Live: contact/deal changes auto-fire matching plays

Bottom line: Workflows is a usable sales automation layer for CRM + outreach + agent steps, not a full Zapier-style engine. HR and deal-won automations live beside it, not inside it.

3. How CRM, Workflows & AI Workforce fit together

```
Workflows playbooks —create task / agent / send→ CRM
Inbox / WhatsApp —qualify inbound→ CRM
CRM —assign agent tasks→ AI Workforce / AI Team
AI Workforce —create_task / update_deal / activity→ CRM
Workflows —agent step→ AI Workforce
```

Module	Role today
CRM	System of record
Workflows	If-this-then-that playbooks on CRM events
AI Workforce	Specialist co-pilot that reads/writes CRM (and HR docs)
